The British Columbia Ministry of Health encourages parents to:

Contact your public health office for information about your child’s:
- Growth and development
- Feeding and nutrition
- Speech and language development
- Behaviour
- Immunizations

Check out the Parent Resources:
- *Toddler’s First Steps*: https://www.healthlinkbc.ca/toddlers-first-steps

Get trusted, non-emergency health information 24 hours a day. Call 8-1-1 or visit www.HealthLinkBC.ca
- Speak to a nurse about your child’s symptoms
- Find a health care provider near you
- Consult with a pharmacist
- Get healthy eating advice from a dietitian
- Translation services are available in over 130 languages on request
- For deaf and hearing-impaired assistance (TTY), call 7-1-1

Visit www.ImmunizeBC.ca to learn more about immunizations.
Birth Information

Child’s name: ________________________________

Date of birth: ________________________________

Place of birth: ________________________________

Personal Health Number: ________________________________

Doctor/Midwife: ________________________________

Length of pregnancy (number of weeks): ________________________________

Birth weight: ________________________________

Head size: ________________________________

Length: ________________________________

Hospital discharge: Date: ________________________________

Weight: ________________________________

Always take this Child Health Passport with you when your child gets immunized. Keep it with other important papers, as your child will need this immunization record when they are older.
Monitoring Growth

Your child should be weighed and measured at all regularly scheduled well-child visits, or at visits when your child is ill, using a growth chart.

A growth chart is a type of graph used to track your child’s growth pattern. It helps show if your child is growing in a healthy way. Your health care provider can help you to understand the results of each growth check.

Talk to your health care provider or local public health office if you have questions about growth monitoring or if you have concerns about your child’s growth. You can also see the resource *Is My Child Growing Well?* at https://www.dietitians.ca/DietitiansOfCanada/media/Documents/WHO%20Growth%20Charts/Is-my-child-growing-well-Factsheet-EN-2019.pdf

Hearing, Dental and Vision Checks

Please contact your local public health office to learn where specific services are available.
Hearing Check (newborn)

Date: ___________________  By: ___________________

Result: ___________________

Dental Check (by 12 months of age or 6 months after the first tooth appears)

Date: ___________________  By: ___________________

Result: ___________________

Vision Check (between 6 and 9 months of age)

By 6 months of age, your child’s eyes should appear straight and work together. If your baby or child appears to have a wandering eye or crossed eyes, or if you have any other vision concerns, make an appointment with an eye doctor (optometrist).

Date: ___________________  By: ___________________

Result: ___________________

It is recommended that all children receive an additional comprehensive eye exam with an eye doctor by kindergarten entry (between 2- and 5-years-old), and yearly after starting school (the cost of eye exams are covered for all children with Provincial health coverage).

Date: ___________________  By: ___________________

Result: ___________________
What is the BC Healthy Kids Program?
The BC Healthy Kids Program helps families with lower incomes with the costs of basic dental care, prescription eyewear and hearing assistance for their children. To be eligible, children must be under 19 years of age and have coverage for Medical Services Plan (MSP) supplementary benefits through the Ministry of Health.

How do I apply for the BC Healthy Kids Program?
Families who have been approved for MSP supplementary benefits will be automatically signed up with the Healthy Kids Program. Your family must have an annual adjusted net income of $42,000 or less to be eligible for these benefits. To access MSP supplementary benefits, you must:

- Apply for MSP Supplementary Benefits with Health Insurance BC (HIBC)
- File your taxes each year with Canada Revenue Agency (CRA)
- Update your MSP account if you have any changes in your family (adding or removing a spouse or child)
What does the BC Healthy Kids Program cover?

- **Dental:** Children are eligible for $2,000 of basic dental services every two years. This includes services such as exams, x-rays, fillings, cleanings and extractions. Your dentist can advise you of other services that may be covered. Emergency dental treatment for the immediate relief of pain is also available if the child’s two-year limit has been reached.

- **Optical:** Children are eligible for prescription eyeglasses (lenses and basic frames) once in a 12-month period. All prescriptions must be current and meet the program criteria. Further information is available from your optical provider. Children’s eye examinations are covered by MSP and families do not need to pay-out-of-pocket for eye exams.

- **Hearing:** Coverage is available for hearing aids and related items if supported by an assessment completed by either an audiologist or hearing instrument provider.

For more information, visit the government website at: [gov.bc.ca/sdpr](http://gov.bc.ca/sdpr) or call the Ministry of Social Development and Poverty Reduction toll-free: 1-866-866-0800
Your Child’s Immunizations

What are immunizations?
Other words for immunization are shot, needle, inoculation, booster, vaccine, or vaccination. Immunizations protect against diseases caused by germs such as bacteria or viruses. Immunizations help your child’s body to make antibodies to fight diseases. Children need different immunizations at different ages, starting at 2 months of age.

What diseases do immunizations help prevent?
Immunizations help to prevent the following diseases:
- Diphtheria
- Pertussis (whooping cough)
- Tetanus
- Hepatitis B
- Polio
- *Haemophilus influenzae* type b (Hib)
- Pneumococcal infections (including severe brain, blood, ear and lung infections)
- Rotavirus
- Meningococcal infections (including severe brain and blood infections)
- Measles
- Mumps
- Rubella
- Varicella (chickenpox)
- Human papillomavirus (HPV)
- Influenza (flu)

Without immunizations, your child could get very sick from these diseases.

Are immunizations safe?
Immunizations are very safe. Side effects of immunizations are usually very minor, like soreness, redness, or swelling where the vaccine was given, or a mild fever. These reactions do not last long and can be treated easily. Serious reactions are very rare. It is much safer to get the vaccine than the disease it prevents.
What is informed consent for immunizations?

Informed consent means that you:

- have been given enough information about
  - immunization safety and the disease(s) the immunization protects against,
  - the benefits, risks and potential side effects of the immunization, and
  - any medical reason(s) why an immunization should not be given to your child;
- understand the information;
- have been given a chance to ask questions; and
- give permission for the immunization to be given.

Someone other than you may take your child for their immunizations. Call your public health office or doctor for information on what to do in this case.

Where can I find more information?

For more details about immunizations, visit www.ImmunizeBC.ca or call your public health nurse, doctor/primary care provider, or HealthLinkBC at 8-1-1.

Translated copies of the immunization schedule are available in Arabic, Chinese, Farsi, French, Korean, Punjabi, Spanish, and Vietnamese. You can find these resources at https://www.healthlinkbc.ca/tools-videos/bc-immunization-schedules#child

Make sure you get all of your child’s immunizations and get them on time for the best protection from serious childhood diseases.
Immunization Schedule and Record

Immunization schedules can change. It is important to immunize on time. You will protect your child from many diseases and help prevent disease outbreaks in your community. Talk to your health care provider, visit www.ImmunizeBC.ca or call HealthLinkBC at 8-1-1 if you have questions.

A Better Immunization Experience for Your Child

Parents are often concerned about the discomfort caused by immunization injections for their infants, toddlers and young children. The following strategies can help reduce discomfort. These strategies can be tried one at a time or in combination.

**Strategies for use with infants:**

**Before the visit:**

Prepare yourself and your child before the appointment. Children are very sensitive to the emotions of their caregivers. Although you may feel anxious, try to remain calm by taking deep breaths and speaking in an even and soft tone of voice.

You may want to purchase a numbing cream or patch for your child. These products are available without a prescription at pharmacies. Apply the product according to the package instructions generally 30-60 minutes before the appointment. For specific information on where to apply numbing creams or patches, ask your health care provider or refer to the diagrams on pages 13 and 15 of this book. Supervise your child carefully while the product is applied. For more information visit HealthLink BC and read *Numbing Creams and Patches for Immunization* ([www.healthlinkbc.ca/healthlinkbc-files/numbing-creams-patches-for-immunizations](http://www.healthlinkbc.ca/healthlinkbc-files/numbing-creams-patches-for-immunizations)).

**During the visit:**

Cuddle your baby firmly in your lap in a seated position, as shown in the diagram. Being held skin-to-skin, or close to your body, is comforting for your baby and remaining upright helps the infant feel more secure.
Encourage your baby to breastfeed before, during and after the immunizations. Close skin-to-skin contact comforts babies and sucking provides a distraction. As well, human milk contains naturally occurring substances that calm babies and reduce pain. Breastfeeding during vaccination is safe for babies, even newborns. There is no evidence that babies will choke or associate their parent with pain. If you are not breastfeeding your baby, you can still hold them skin-to-skin to provide comfort.

If your baby is formula fed and is 12 months of age or younger, they can be given a sucrose (sugar) solution immediately before the immunization. Research shows that this solution causes the brain to release pain-reducing substances. The oral rotavirus vaccine recommended for infants at the 2, 4 and 6 month visits contains sucrose and has a similar effect as an oral sucrose solution. For information on how to prepare a sucrose solution see *A Better Immunization Experience for your Child* at [www.healthlinkbc.ca/healthlinkbc-files/immunization-experience-child](http://www.healthlinkbc.ca/healthlinkbc-files/immunization-experience-child).

Sugar or sucrose solutions should not be used at home to calm upset or crying babies.

Distraction with a light-up toy, bubbles, or a pinwheel can be used immediately before and during the injection. The part of the brain that processes pain is less active when infants and children are distracted.
Strategies for use with toddlers and young children:

Before the visit:
As with infants, toddlers and young children respond to their caregiver’s level of anxiety about immunization visits.

Use a matter-of-fact, non-apologetic approach when talking to your toddler or young child about immunization visits.

Inform your child about the immunization as close to the actual appointment time as possible. When discussing the visit with your child, stay calm and speak in an even and soft tone of voice. Answer questions honestly, using words that reduce anxiety (e.g., “you may feel pressure, squeezing or poking”). Don’t use words such as “pain,” “hurt,” or “sting.”

Try not to use words that focus the child’s attention on the needle (e.g., “It’ll be over soon and you’ll be okay”), give false reassurance (e.g., “It won’t hurt”), or apologize (e.g., “I’m really sorry you have to go through this”).

Numbing creams or patches may be used as described in the infant section. For children over 12 months of age, ask your health care provider before your visit where your child’s immunizations will be given so that you know where to put the cream or patch.
During the visit:

Have your immunization provider help you position your toddler in a secure, comforting, upright position. Use distractions such as bubbles, a pinwheel or a squeaky, light-up or musical toy to distract your child immediately before and during the injection. Invite your child to participate in the distraction by blowing the bubbles or pinwheel. Remind your child to engage in the distraction throughout the immunization.

Trying these techniques can turn immunization appointments into a chance to teach children skills for dealing with potentially scary or difficult situations in the future.
What to Do if Your Child Has a Reaction Following Immunization

Common vaccine reactions (such as soreness, redness, and swelling in the leg or arm where the vaccine was given, or a low fever) may make your child uncomfortable, but these are not harmful. They will generally subside in a day or two. Here are some things you can do to help your child be more comfortable.

For a fever:
- let your child breastfeed more, or offer more to drink
- take off extra clothes that your child is wearing
- give your child medicine to help bring down the fever and make your child more comfortable (see pages 18 and 19 for more information)

<table>
<thead>
<tr>
<th>Body Site</th>
<th>Normal Range</th>
<th>Fever</th>
</tr>
</thead>
<tbody>
<tr>
<td>armpit</td>
<td>36.5–37.5 °C</td>
<td>97.8–99.5 °F</td>
</tr>
<tr>
<td>mouth*</td>
<td>35.5–37.5 °C</td>
<td>95.9–99.5 °F</td>
</tr>
<tr>
<td>ear</td>
<td>35.8–38 °C</td>
<td>96.4–100.4 °F</td>
</tr>
<tr>
<td>rectal (bum)**</td>
<td>36.6–38 °C</td>
<td>97.9–100.4 °F</td>
</tr>
</tbody>
</table>

* Do not use for children under five years of age.

** Only use a rectal thermometer if you are comfortable doing so and a health care provider has showed you how to take a rectal temperature safely.
If your child cries more than normal or has soreness in the arm or leg where the immunization was given:

- cuddle your child
- put a cool cloth on the arm or leg where your child got the immunization
- give your child medicine to help make them comfortable (see pages 18 and 19 for more information)

If your child gets a small hard lump in the arm or leg where the immunization was given:

- The lump may last 1 to 4 weeks but it will go away and it doesn’t hurt. There is no reason for concern.

If your child has a serious reaction to an immunization:

- It is important to stay in the clinic for 15 minutes after getting any vaccine because there is an extremely rare possibility, less than 1 in a million, of a life-threatening allergic reaction called anaphylaxis. This may include hives, difficulty breathing, or swelling of the throat, tongue or lips. Should this reaction occur, your health care provider is prepared to treat it. If symptoms develop after you leave the clinic, call 9-1-1 or your local emergency number.
- If you child does have a serious reaction to a vaccine, be sure to record it on page 21 and tell your health care provider about it before your child’s next vaccination.

If you are concerned about any reactions, call your health care provider or HealthLink BC at 8-1-1.
Medicines to Help with Fever and Pain

There are two kinds of medicines to choose from to help bring a child’s temperature back to normal or to help with pain following immunization. They are acetaminophen and ibuprofen. Ibuprofen should not be given to children under 6 months of age without first speaking to your health care provider.

Fever medicine brand names:

<table>
<thead>
<tr>
<th>Acetaminophen</th>
<th>Ibuprofen</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abenol</td>
<td>Advil</td>
</tr>
<tr>
<td>Atasol</td>
<td>Motrin</td>
</tr>
<tr>
<td>Tempra</td>
<td></td>
</tr>
<tr>
<td>TYLENOL</td>
<td></td>
</tr>
</tbody>
</table>

Do not give Aspirin or other drugs that have acetylsalicylic acid (ASA) in them to anyone under the age of 18 unless a doctor has prescribed it. Medicines that contain ASA may cause Reye syndrome in children and teenagers (a condition that causes damage to the brain and liver).
How much medicine should I give my child?
Follow the directions on the package label. This label tells you how to give the medicine safely and how much medicine to give. This is important because there are different strengths (concentrations) of medicine within each brand. To give the correct amount, you need to know your child’s weight.

Always read the label of the product you are using very carefully so that you give the right amount of medicine to your child.

How often should I give medicine to my child?
- Give acetaminophen every 4 to 6 hours as needed. Do not give more than 5 doses in 24 hours.
- Give ibuprofen every 6 to 8 hours as needed. Do not give more than 4 doses in 24 hours.
- Do not give ibuprofen to children under 6 months of age without first speaking to your health care provider.
- Speak to your health care provider as soon as possible if your child is less than 3 months old and experiences a fever. This is to make sure that a young baby’s fever is not a sign of an unrelated serious illness.

If you are unsure about which medicine to use or how much to give your child, contact your health care provider, pharmacist, or call HealthLink BC at 8-1-1 (available 24/7).
Child Safety

- Use a correctly installed, approved car seat or booster seat for every ride, even short trips. For more information, visit https://www.bcaa.com/community/child-car-seat-safety
- Put your baby to sleep on their back in a safe sleep space that is free from dangers like soft bedding, pillows, and toys. To learn more about safe sleep for your baby, including information about safer bedsharing, talk to your health care provider, visit HealthLink BC, or download Safer Sleep For My Baby at https://www.healthlinkbc.ca/hlbc/files/pdf/safer-sleep-for-my-baby.pdf
- Provide a smoke-free environment for your child.
- Check bath water temperature before placing your child in the water. Water should feel warm, not hot.
- Check product recalls regularly at https://www.canada.ca/en/health-canada/topics/consumer-products.html or by visiting manufacturers’ websites.
- Stay with your child when they are eating, in the bathtub or near water.
- Know what to do if your child is choking, and be sure your child’s caregivers know what to do too. Learn more at https://www.healthlinkbc.ca/health-topics/chkng#uk1001
- Do not heat baby bottles in the microwave.
- Install smoke alarms near all sleeping areas of the home.
- Protect your infants and children from sunburn.
For more information on child health and safety, see *Baby’s Best Chance* and *Toddler’s First Steps*, visit [www.HealthLinkBC.ca](http://www.HealthLinkBC.ca), contact your health care provider or contact HealthLink BC at 8-1-1.

Health Office Stamp
Pregnancy and the early years of a child’s life are times when all families can benefit from support and encouragement. Many services exist in B.C. and in your community that can support you and your family during pregnancy, after birth and as your child grows. Contact HealthLink BC (8-1-1) or speak with your health care provider if you have questions about:

- Preparing for pregnancy or parenting (e.g. healthy eating, exercise, decreasing or quitting smoking, alcohol and other substances)
- Caring for yourself emotionally and physically during pregnancy and in the early years of your child’s life
- Feeding your child, including providing breastfeeding/infant feeding support
- Keeping your baby safe through immunization, car seat safety, providing a smoke free and safer sleep environment, baby proofing your home, and preventing Shaken Baby Syndrome
- Caring for your baby, including supporting your child’s growth and development, dental, hearing and vision, bonding and positive parenting
